| Predictor | Description |
|---|---|
| *RR* (recurrence rate) | Measures the percentage of recurrent points falling within a tolerance radius $\varepsilon$ in the $N \times N$ recurrence matrix (0% to 100%) |
| *DET* (determinism) | The percentage of recurrent points that form diagonal line structures of at least minimum length $l_{\min} = 2$, reflecting system predictability |
| *NRLINE* | The total number of diagonal lines in the recurrence plot |
| *L* | The average length of diagonal lines, describing the mean duration of similar trajectory evolution |
| *ENTR* (Shannon entropy) | The Shannon information entropy of the diagonal line length distribution, quantifying dynamical complexity |
| *rENTR* | Normalised Shannon entropy (entropy normalised by the number of diagonal line lengths) |
| *LAM* (laminarity) | The percentage of recurrent points that form vertical line structures of at least minimum length $v_{\min} = 2$, capturing state persistence |
| *TT* (trapping time) | The average length of vertical line structures, measuring the mean time the system remains trapped in a laminar state |
